Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The source of human erbB-2 protein for the prodn. of antibodies no 23 and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell engineered to express the human erbB-2 protein on its surface (N/erbB-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. I animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

                                                                                                                                                                                      inhibition of proliferation or survival of, esp. malignant erbB2, realls - by introducing nucleic acid mol. encoding antibody homologue which is expressed and binds, pref. erbB2, protein intracellularly bisclosure; page 29-30; 48pp; English.

A nucleic acid comprises a first sequence encoding a signal peptide (R94019) linked to a second sequence (T17728) encoding a single chain Fv fragment (R94020) that binds a human erbB2 oncoprotein.

The anti-erbB2 sFv portion is obtained by PCR using e23scFv plasmid as template. The signal peptide directs the scFv to the endoplasmic reticulum. The nucleic acid is incorporated into a plasmid or viral vector to facilitate expression of the scFv antibody homologue within e.g. an epithelial carcinoma cell. Intracellular expression of the homologue inhibits surface expression of erbB2 and thereby inhibits cell proliferation and cell survival and decreases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence comprises the L and H chains of murine MAb OVB3, joined together via a linker. The sequence is encoded by clone poVB3158-1 in which the 3' end of the DNA is linked to the 5' end of the coding sequence for PE40, a Pseudomonas exotoxin lacking domain I. The protein expressed by the clone can be used to Lank specific target cells.

                                                                                                                                                                                                                                                                The source of human erbb-2 protein for the prodn. of antibodies n 23 and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell 23 and 21 (Q55180/R45442; Q55181/R45443) is a NIH/3T3 cell engineered to express the human erbb-2 protein on its surface (N/erbb-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbb-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely regressed after 11 days.

ce fv fragment encoded by pSCVI was able to proceed infection by HRV-14. It was less active than mod ce which included a Gly-Gly-Gly-Gly-Ser flexible lift ce and H chains as either a monomer or a dimer see also R15437-R15442.

Sequence 240 AA.

Using the methods, scFv can be produced in E. coli, either in a soluble fraction or in inclusion bodies. Like the parent double chain antibodies, the scFv polypeptides are useful in immunological diagnosis or for separation and purification, but they lessen the side effects caused by antibody constant regions. The availability of scFv polypeptides contributes to fundamental research and development of diagnostic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Single chain anti-Fc gamma RI antibody fused to anti-CEA Humanised antibody; anti-Fc receptor; H22; bifunctional; fusion protein; chimera; carcinoembryonic antigen; CEA.

A mammalian expression construct encoding a single chain antibody having binding specificity for Fc gamma RI, derived from the humanised anti-Fc gamma RI monoclonal antibody H22 was prepared (see T58129). A bispecific single chain polypeptide was produced by fusing the H22 scFv to an anti-carcinoembryonic antigen (CEA) antibody. The H22-anti-CEA fusion protein was shown to bind both for gamma RI and CEA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fc gamma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PT a target cell

Example 8; Fig 40; 57pp; English.

CC This sequence represents the construct 321, which is a fusion between an CC anti-CEA antibody and a multispecific single chain antibody designated CC 422. The antibody can be used in the method of the invention for inducing CC antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell CC which is characterised by overexpression of HER 2/neu or epidermal growth CC factor receptor (EGFR), comprises contacting the tumour cell with a CC multispecific protein molecule (preferably a single chain antibody) CC comprising: (a) an anti-FC receptor antibody or an antigen bhinding CC fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which binds to EGFR. The method can be used for treating cancers especially CC breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection CC by a target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Single chain poly:peptide for binding antigen - comprising light and heavy chain antigen binding portions linked by peptide linker Example 9; Figure 39; 78pp; English.

The single chain polypeptide is derived from the mature light and the single chain polypeptide is derived from the affinity for a given antigen (Fluorescell). It comprises a first polypeptide comprising the antigen binding portion of of the light chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the heavy chain variable region of an antibody and a second polypeptide region of an antibody and a second polypeptide cregion of an antibody and at least one peptide linker linking the first and second polypeptide chains. The resulting single chain collippeptide can be used in diagnostics, therapy collippeptide chain vitro and in vitro), imaging, purifications and biosensors. This particular single chain binding molecule was designated in 2-2-3/TRY202' and contains one linker peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of the light and heavy chains of anti-fluorescein monoclonal antibody (Mab) 18-2-3 linked by a peptide designed to fit into a groove on the backside of the variable domain structure. The DNA construct was inserted into vector pGX3703 and introduced into E. coli. 18-2-3/TRY202' was produced as a single chain molecule. It exhibited biological binding activity equivalent in specifically and affinity to that of the original Mab.

Example 9; Fig 39; 78pp; English.

A DNA construct (T13739) codes for single chain binding molecule R2-3/TRY202' (R99649), in which VL and VH regions of antifluorescein monoclonal antibody 18-2-3 are joined by a peptide linker composed primarily of alternating Gly and Ser residues, with Glu and Lys residues to enhance solubility. The construct was expressed in E.coli. Soluble, folded chain antibody (SCA) was cobtd. which was capable of exhibiting a biological binding activity equivalent in specificity and affinity to that of a monoclonal advantages of smaller size, greater stability and reduced cost.
                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                       The sequence was constructed from the variable regions of an antifluorescein MAb, 18-3-2, an IgM. The VL and VH cDNA sequences were synthesised by priming on RNA isolated from hybridona cells. The sequence encodes a single chain binding molecule comprising the variable regions of heavy and light chains linked by peptides. The peptide linker was computer-designed to fit inyo a groove on the backside of the variable domain structure and is composed primarly of alternating Gly and Ser residues. Glu and Lys residues see also R06476-R06484.
